

1. Overview

- 1.1. When using VirtualBox (VB) in a host computer and operating a virtual machine (VM) are required to collect exam data directly to an USB drive but if the EXPORT drive is not properly working, or the host computer has only one USB port, or one of the USB ports is malfunctioning, then this document will guide you in configuring a shared folder in your host computer to access utilities to perform examinations and collect exam data directly from the VM to the shared-folder.
- 1.2. It is essential that you prepare the shared folder in your host computer and configure your laptop (Windows or Mac) to give access to the VB application and VM to access and have write permissions to said shared folder.
- 1.3. The *VirtualBox User Manual* is very detailed and intended to be used by the student, in addition to this document, to assist the student through the process to setting up the shared folder in the host-computer and installing *GuestAdditions* to allow access to the shared folder from the VM.
- 1.4. Each operating system and Incident Response (IR) tool is different, so it is essential that you're familiar with your own laptop's operating system to determine the level of access/write permissions that may be assigned to VB and VM.
- 1.5. The limitation of this guide is only limited on your ability to understand your own computer or laptop so that the appropriate configurations can be successfully using the appropriate Operating System support documentation and your ability to use the *VirtualBox User Manual*.
- 1.6. This guide is only applicable for *Windows computers* and *MacOSX Intel processor chip laptops ONLY* – it is NOT intended to be used for any laptop that is using Mac OSX M1 or M2 processor chip. (See screenshots below).

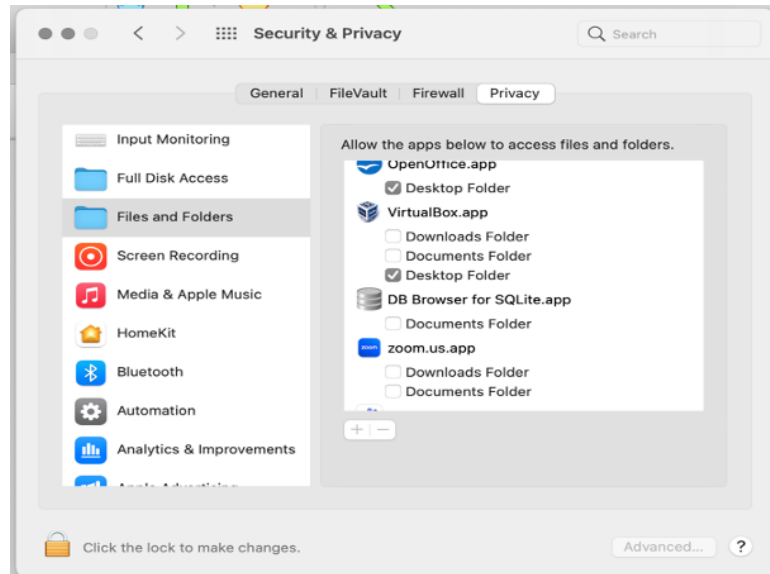

2. Configuring MacOSX Laptop

- 2.1. Set up a shared folder in your host computer/laptop and give permission to the VB application and its users (you) to read-write to the shared folder.
- 2.2. To minimize risk of errors, the shared folder MUST be in the laptop's own hard drive and NOT a 'cloud' share folder.

Configuring VM Shared Folder in the host computer and accessed by the VM

- 2.3. When configuring your MacOSX host computer, you may need to configure the File and Folders Security and File Sharing permissions or similar configuration depending on your own laptop.

- 2.4. When configuring a MacOSX host computer, you may need to configure the specific folder you want to share with VirtualBox and the Virtual Machine.

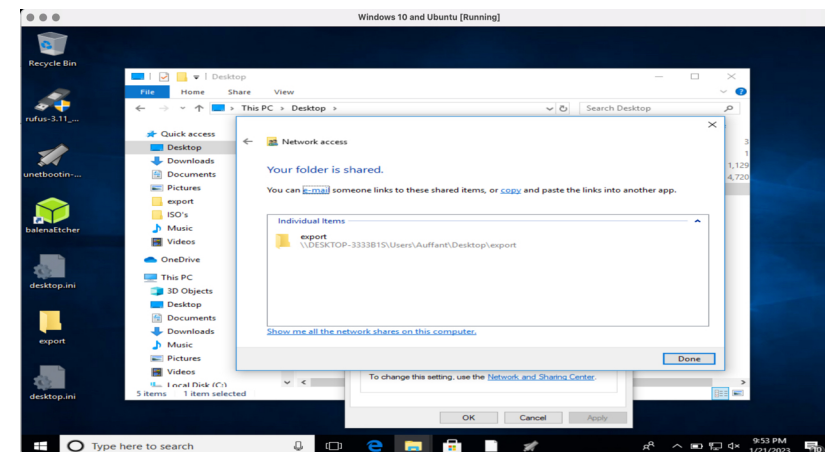

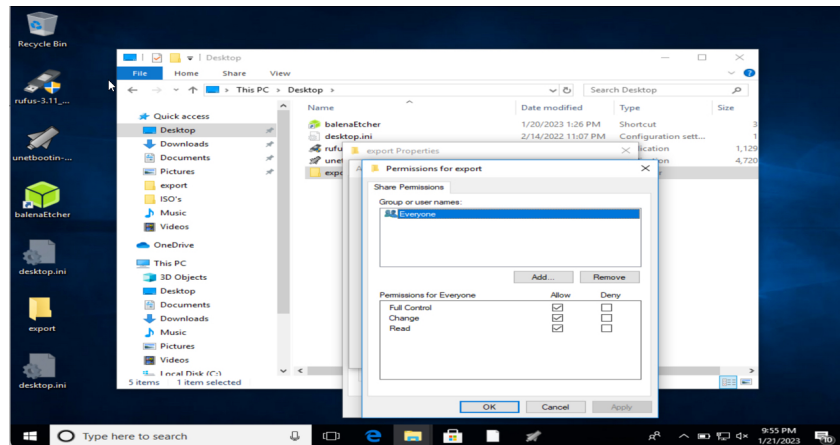

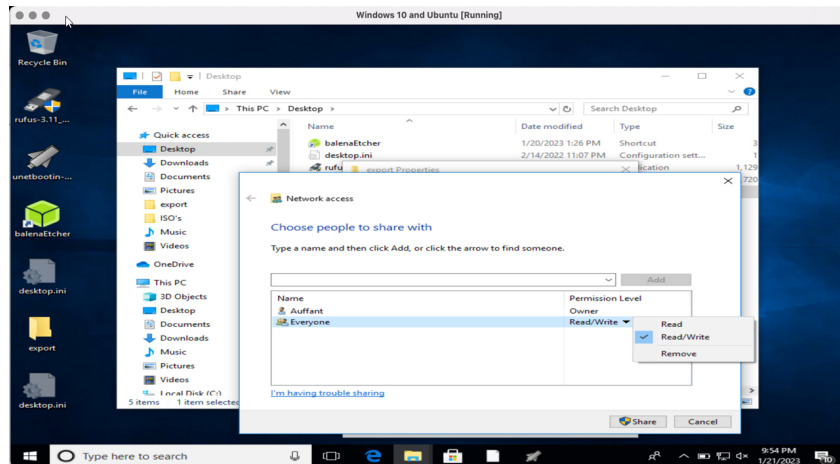

- 2.4.1. Typically, the easiest folder to configure and share is the *Desktop* of your computer or the **'export'** folder that you created on your Desktop folder, as shown below.

Configuring VM Shared Folder in the host computer and accessed by the VM

3. Configuring Windows laptop

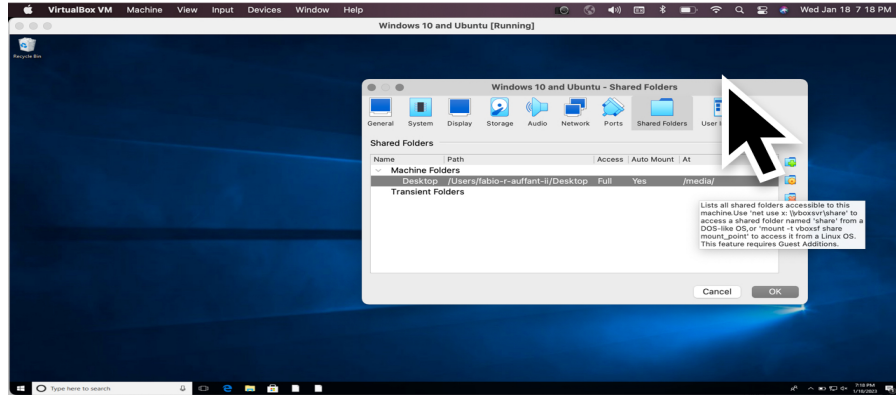

- 3.1. Set up a shared folder in your host computer/laptop and give permission to the VB application and its users (you) to read-write to the shared folder.
- 3.2. When configuring a Windows host computer, you may need to configure the Folder Sharing permissions or similar configuration depending on your own laptop.
 - 3.2.1. Typically, the easiest folder to configure and share is the *Desktop* of your computer or the **'export'** folder that you created on the Desktop folder, as shown below.

Configuring VM Shared Folder in the host computer and accessed by the VM

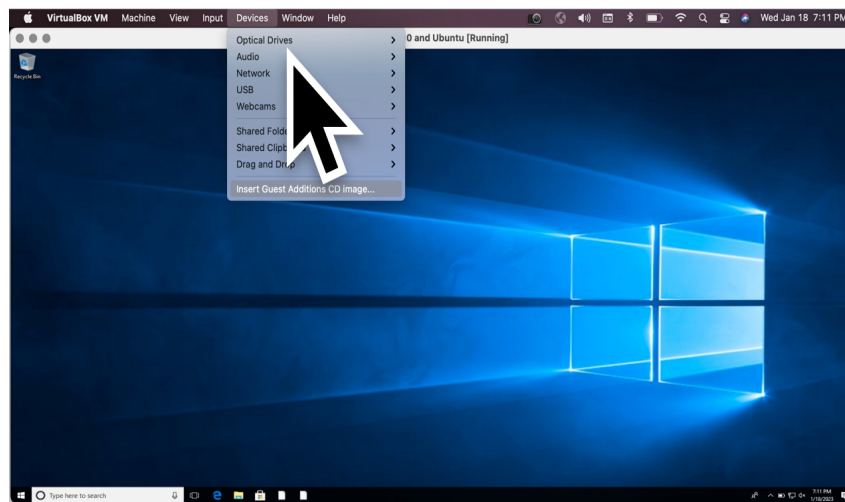

4. Configuring VirtualBox

- 4.1. Configure the VB application by adding the shared folder and selecting the appropriate configuration via the Settings/Shared Folders, as shown below.

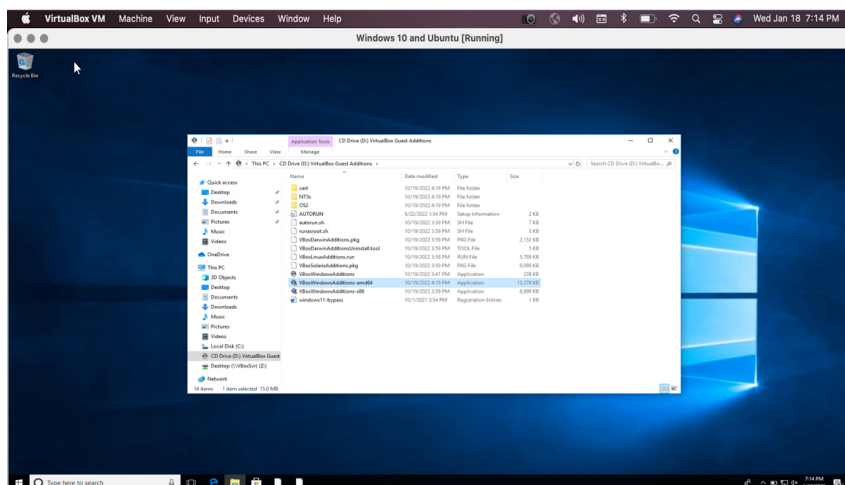

5. Configuring Virtual Machine in the Windows VM

- 5.1. Operate the Windows VM and after booting to the *Desktop* folder you may access the Guest Additions package by selecting *Insert Guest Additions CD image* from the *Devices* menu on your host computer.

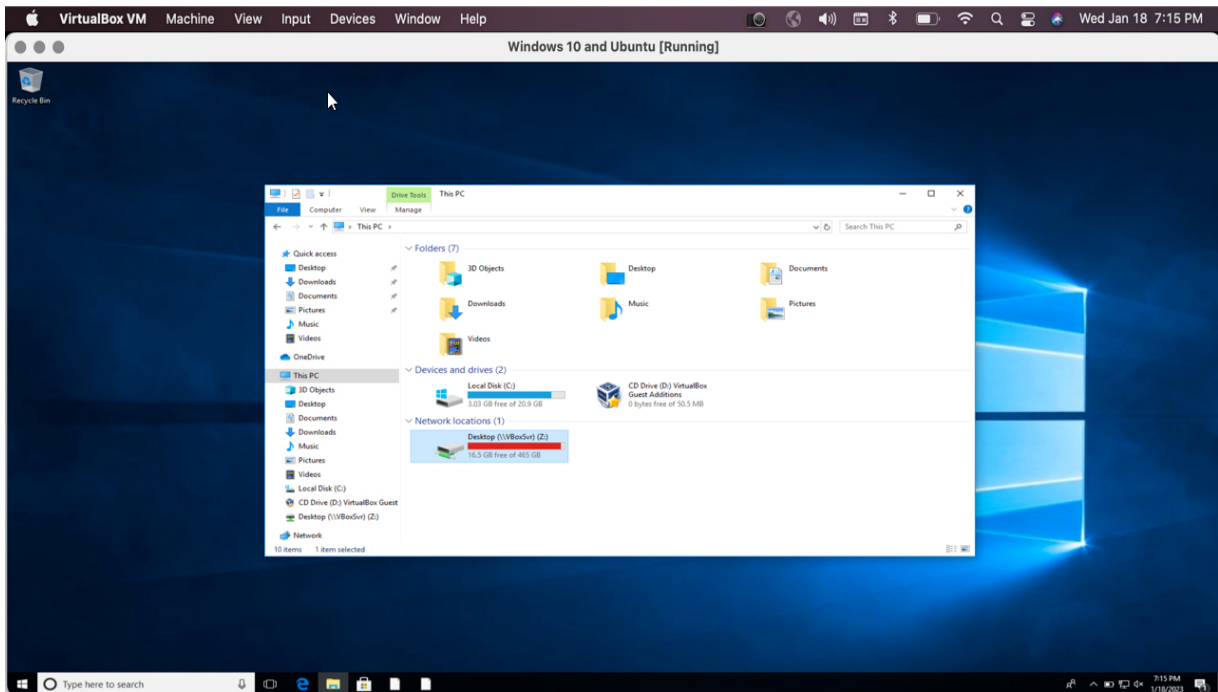

- 5.2. Once the *Guest Additions CD image* is loaded into the Windows VM, the image file contents will be available via a mounted volume (possibly 'D' drive). Proceed to install via *VBoxWindowsAddition* executable via the Windows VM.

Configuring VM Shared Folder in the host computer and accessed by the VM

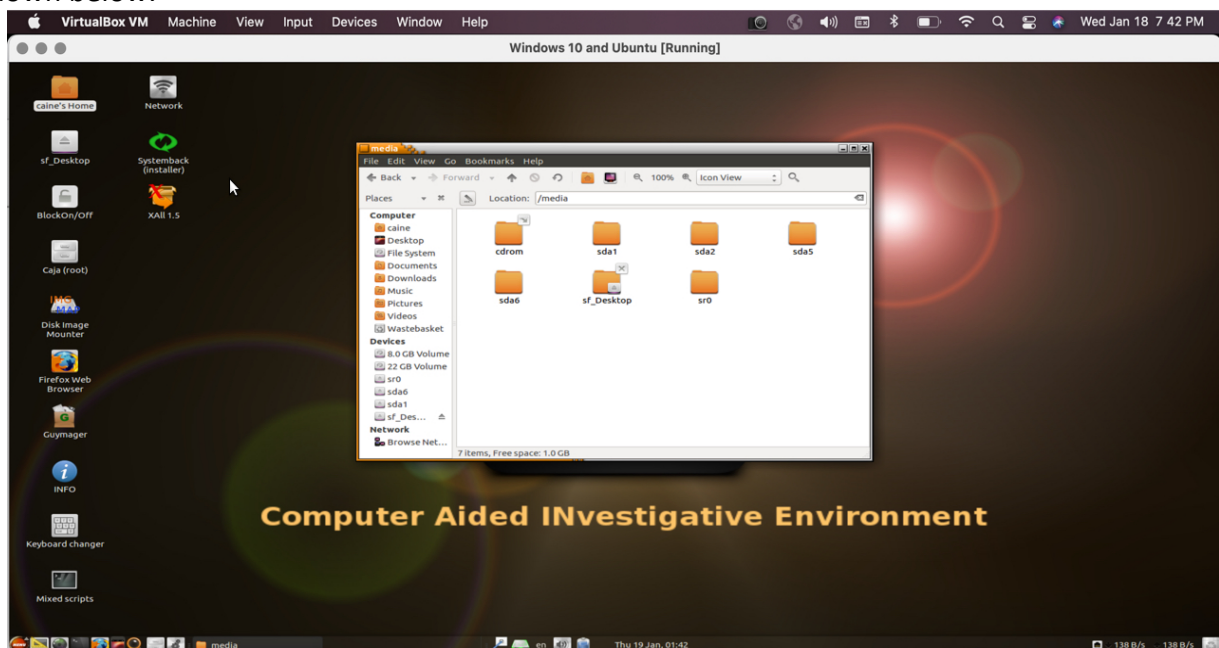

- 5.3. After installation of the Guest Additions application to the Windows VM then a new network volume will be available (possibly 'Z' drive), which is your host computer's shared folder, *Desktop* as shown below.

- 5.4. You may now copy/paste or drag/drop exam data files from the Windows VM to your host computer's shared folder.

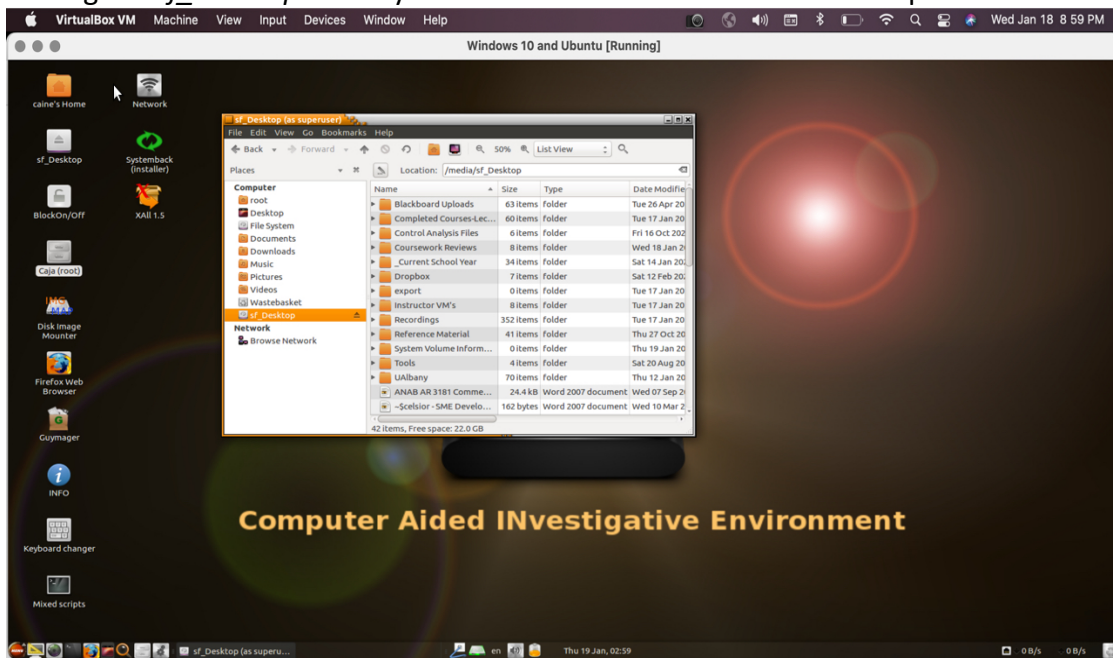

6. Configuring Virtual Machine in KALI/KNOPPIX/DEFT/CAINE/PALADIN

- 6.1. Boot your dual-boot VM using the assigned KALI or KNOPPIX or DEFT or CAINE or PALADIN ISO file and once you're in the *Desktop* folder open the File Manager and the host computer's shared folder (*Desktop*) should be *sf_Desktop* in the devices column, as well as the */media* directory (VM setting), as shown below.

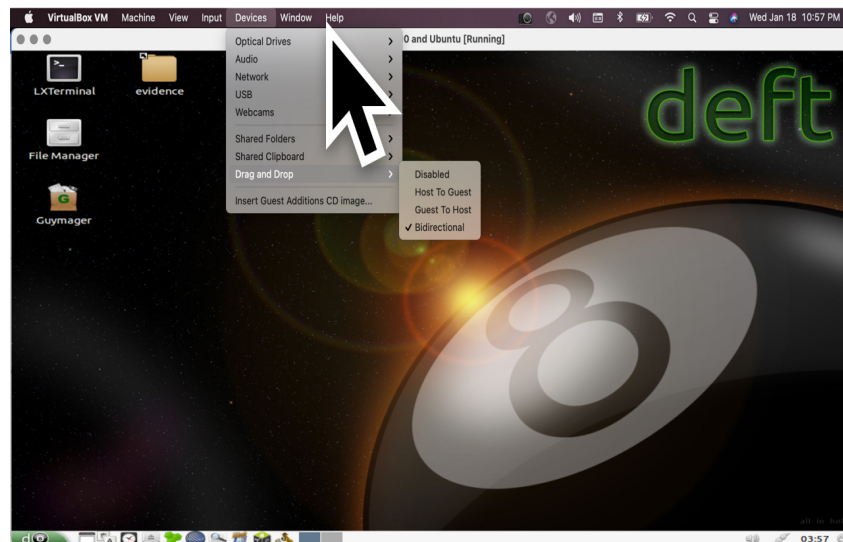

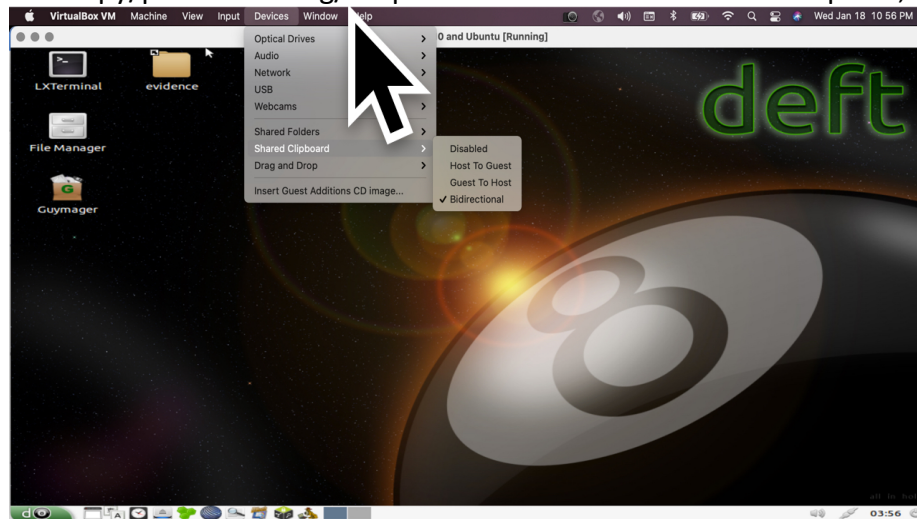

Configuring VM Shared Folder in the host computer and accessed by the VM

6.2. By expanding the *sf_Desktop* folder you should have access to the host computer's shared folder.

6.3. You may also need to select the appropriate *Clipboard* and *Drag/Drop* VB settings via the *Devices* menu to facilitate copy/paste and drag/drop files between VM and host computer, as shown below.

7. Storing your DEFT or CAINE Live Exam Utilities in your laptop's shared folder

- 7.1. This section is not applicable to Kali, Knoppix or Paladin.
- 7.2. Prepare for an examination of a Live Virtual Machine in case of DEFT OR CAINE drive or USB port failures of your laptop, of limited USB ports in your laptop, you may use the Shared Folder to use live tools to examine the evidence Windows VM.
- 7.3. Identify the DEFT-CAINE live examination applications/utilities to copy to the Shared Folder. For this course, it is recommended that a minimum the following folders/files should be copied from the DEFT OR CAINE USB drives into the Shared folder:
 - 7.3.1. NirSoft
 - 7.3.2. QuickHash
 - 7.3.3. Screeny
 - 7.3.4. MWsnap
 - 7.3.5. WinAudit.exe or WinAud.exe

8. Additional Workaround Guide

- 8.1. If the above configurations fail to properly display your laptop's shared folder in the Virtual Machine, then utilize the *2023 - B Myers - VBox access to host computer shared-folder - work-around guide - Rev Dec2023.pdf* found via the **Course Materials** course link to further assist you in the configuration of the shared folder from the VM.
